

Top Insights from the Chat

Session 8 · AI opportunity mapping · Questions, answers, and standout ideas

The chat ran hot through a long, hands-on session. This is a filtered read of the questions that mattered to everyone, each attributed to the person who asked, with the answer or takeaway where one was given. Reactions, roll-call, and Miro glitch chatter have been left out.

1. The Method and the PM Role

The sharpest questions were about how this activity actually works as a piece of product practice, and where it sits in a wider AI project.

Asked by	Question	Answer or takeaway
usha	Is this a group activity an AI PM should do with a team, with stakeholders and the final user, not a one-person effort?	Yes. Aakash confirmed it is generally done with the team and business stakeholders. Karan added that more stakeholders is better, because it builds buy-in.
Kashish Bhatnagar	To confirm the flow: the first activity is secondary research to find user pain points, then AI cards to shape the solution, then prioritise to an MVP, prototype, validate with the customer, and finally design and build?	Karan confirmed: "Yes Kashish!"
Abhishek Timmaraju	This was just one step. What does it look like across multiple steps, and do we repeat the same exercise for every step?	Yes, the same exercise repeats per step. Abhishek's own takeaway landed it: look at the step with the most friction and solve that one first.
usha	So it is almost like predefined steps, where you do not reinvent the wheel?	Right. The method is a reusable template; you fill the gaps rather than start from scratch each time.

Key Insight (from Kashish Bhatnagar)

Kashish stitched the whole arc together in one message: research the pain points, use the cards to generate solutions, prioritise to an MVP, then prototype, validate, and build. It is a clean mental model for where opportunity mapping fits in the larger product flow.

2. Working with the 33A AI Cards

The cards caused the most confusion, mostly because people tried to read them too literally or wondered if they were a Miro feature.

Asked by	Question	Answer or takeaway
Yamini Shah	Is the AI card part of Miro's functionality?	No. The cards are made by 33A and were purchased; for the cohort they live on the Miro board.
Suman	Are the AI cards just for information, or do we map them to activity points?	You map them. Srikanth and Aakash confirmed the cards get used on the board in the later stages.
usha	Are these AI cards possible steps? I am struggling to map the steps to the cards.	Treat the card title as direction and the back as context, not a literal instruction. Aakash framed it as referring to a card to specify an AI use case at a high level.
usha	Are the cards for one certain step, or for all steps?	Karan: just for step 2 here. The same exercise then repeats for the other steps.
Karthikeyan N	How do I select a relevant AI card for a task or step, and how do I evaluate them?	Scan the card categories as a mnemonic (find and organise, gain insights, perform tasks, read and write) and pick what fits the task at hand.
Abhishek Timmaraju	What is a Joker card?	A customisable card for a use case the existing cards do not cover. Karan said he has rarely needed it.

Key Insight (from Srikanth Reddy Dongala)

Srikanth gave the cleanest rule for the cards in one line: consider the title of the card, not the exact description on the back, and treat that description as context. That is the whole "seeds, not answers" idea in a sentence.

3. Process and Mapping Clarifications

A run of small but important clarifications kept the board honest, especially around what the pain points referred to.

Asked by	Question	Answer or takeaway
rohitdoad	What is meant by "new solutions" for the associated pain points?	Aakash: the current digital platforms in use. The pain points describe what hurts with today's solution.
Trishala	Why are pain points only tied to the new solution? Surely they belong to the existing solution.	Correct. Karan acknowledged a copy-paste labelling error; the pain points are associated with the current solution, not the new one.
Trishala	What should the end goals be, how many steps do we have, and what does each step achieve or improve?	Karan answered these by the end of the activity, as the full map came together.
usha	Aren't we assuming the job-portal questions will not change? These are third parties and change constantly.	Exactly why a "create text" card is needed, so content can be regenerated per platform as their forms change.

4. Recruitment Domain Knowledge

Several participants brought real hiring experience that sharpened the case well beyond the textbook version.

Shared by	Insight
Aakash Pardeshi	As general practice, technical recruiters are given the screening questions and acceptable answers before the screening call.
Aakash Pardeshi	A reapplication cooling period is typically applied when adding a candidate to the recruitment system, and it varies from three months to a year.
Prakash	Raised checking the history of past interviews for red flags, and whether internal blocking policies or cooldowns affect a re-applicant's eligibility.
Trishala	Choose platforms relevant to the location (Indian job boards for India) and the sector, factor in cost, and most importantly post on the company's own platform.
ODHALA AISHWARYA	Wrote a full two-card use case: AI summarises the hiring manager's raw requirements into a clean JD, then AI spots engagement patterns across platforms and proactively suggests outreach to matching people in the network.

Key Insight (from ODHALA AISHWARYA)

Aishwarya's two-card write-up is a model of how to turn a seed card into a concrete step: one card cleans the requirements into a postable JD, the other watches platform engagement and pushes targeted outreach. Specific, useful, and tied straight to the recruiter's pain.

5. Responsible AI and Guardrails

As the activity moved into guardrails, the chat produced some genuinely thoughtful risk thinking.

Shared by	Insight or question
Abhishek Timmaraju	Since we connect to multiple platforms, securing identity is critical because it may involve PII.
usha	Flagged the risk of an iterative loop if someone gets hold of the system, pointing toward human-in-the-loop control.
Abid Fayaz	"Right incentives" as a misuse risk: HR could use AI to post roles that do not exist just to create hype that the company is hiring. A clear example of AI used the wrong way.
Abid Fayaz	Observed that the Fairness and Dignity cards feel like the same thing, a fair challenge on overlapping guardrails.
Srikanta and Sri Ram Avinash M	Named concrete failure modes for the new solution: wrong output, and posting to an incorrect vendor.

Key Insight (from Abid Fayaz)

Abid's "fake job postings to create hype" example is the kind of misuse risk that is easy to miss. It is a reminder that guardrails are not only about model error; they also have to cover humans using an honest tool dishonestly.

6. Careers, Practice, and Keeping Up with AI

usha drove a thread that many in the cohort clearly felt: how do you keep pace, and how do you practise this if you are not in a corporate job?

Asked by	Question	Answer or takeaway
usha		Karan: you cannot keep up with everything, and trying gives you anxiety and FOMO. Follow only the models that break

Asked by	Question	Answer or takeaway
	How does the Codebasics team keep up to date with how fast AI and its tools are changing?	benchmarks and make the news, and lean on a weekly team summary.
usha	How do we practise this skill, especially as non-corporate people?	Do it repeatedly. Use ChatGPT or Claude to generate processes (for example, retail) and map those, or find real problems in your own organisation.
usha	If this is done well, the recruiter's tasks shrink. Could they be out of a job?	Aakash: the aim is to make HR's life better, not to remove the person.

Key Insight (from Aakash Pardeshi)

On staying relevant, Aakash's advice was simple and quotable: pick a niche and build expertise around it. A useful counterweight to the firehose-and-FOMO trap.

7. Tools the Cohort Uses

Tooling came up throughout, both the canvas and the AI assistants people reach for.

Tool	How it came up
Miro	The canvas for the whole activity. Karthikeyan asked if there was a specific reason to use it; Karan noted it suits dashboards and canvases, and offers a free account.
Figma and Canva	Named as equivalent canvas tools that can run the same mapping.
33A AI cards	The seed-idea deck, purchasable at 33a.ai/aicards-order , used here on the Miro board.
ChatGPT and Claude	Suggested as a way to generate AI use cases and to spin up practice processes.
ATS and job boards	LinkedIn, Indeed, Naukri, and Monster surfaced repeatedly as the platforms the process touches.

8. Closing Reflections

The honest read on the session, in the cohort's own words, was that it was valuable but demanding.

From	Reflection
Abid Fayaz	"The activity was easy to watch but hard to do hands on." An honest take that many echoed.
Trishala	Called it a very nice workshop: explained step by step, with the thought process of what to select and why made clear, and the 33A cards a new learning. She thanked Srikanth for assisting Team C in the breakout room.
Vinay	Found it a deep insight into mapping pain points and solutions with the business directly involved, and saw how it correlates with his day job, not just AI work.
usha	"My brain is full. This was a great session."
