

LinkedIn Job Recommendations: Rate employers

User Journey:

A user with a profile on LinkedIn, will get job recommendations. A user can go to her LinkedIn profile and just go to the jobs tab.

JTBD

This feature shows the user jobs that she is a good fit for, without having to do a manual search or setup a search or query on her own. The user will choose this because it removes the need to search for jobs, or at least that is the idea.

Trade-off

Personalization is off IMO at least from a candidate perspective, job recommendation does not take into consideration, interests, location, posts liked and more.

Accuracy is off as well, because while job recommendations are good, but not upto the mark.

In regards to prioritization, I think they prioritized some smart search, I cannot comment on what they used, but it needs work.

Problem not solved and why it matters

1.The system does not show where an interested candidate stands relative to the people who have applied so far, at this time it only show some analytics which is not enough. This has probably been consciously left unresolved due to privacy reasons and since everything is relative, and it might prevent users from applying.

2. LinkedIn does not show if an employer is good/bad/ugly , Culture, diversity, benefits ,hiring and firing practices, taking pet to work ,pet insurance, interview process/steps and more are all important criteria for a candidate to choose a company. There is no system in LinkedIn that shows employer grading, this is the missing part of the puzzle.

Adjacent opportunity :

1. In regards to showing candidates how they stand relative to other applied candidates , a parallel feature would be to customize resume, or show training options free and paid to improve the candidate profile
2. In regards to rating Employers, a adjacent opportunity would be to create a system to take feedback from employees , interviewing candidates and more.Glassdoor has this but it feels random.
